"The Relationship of the Strength of Bones to the X-Ray Densitometric Equivalent Measured in vivo."

Budapest, Kiserletes Orvostudomany, Vol 15, No 1, Feb 63, pp 25-26.

Abstract: [Authors' Hungarian summary] Authors studied the ash content, breaking strength, elasticity modulus and the aluminum equivalent measured X-ray densitometrically in vivo, of the femur of white rats, and analysed the interrelationship of these data by the usual biometric methods. The radiometric test yielded the following correlation coefficients: 0.92, total ash; 0.38, bone strength; 0.52, elasticity. Based on the calculated regression equations, it is possible to obtain correct information on the two most important biological characteristics of bone, mineral content and breaking strength, from the aluminum equivalent. Of 13 references, 4 are Eastern European, the rest is Western.

"Composition of the Lipids of Human Organs and Tissues"

Budapest, Orvosi Hetilap, Vol 107, No 25, 19 Jun 1966, pp 1162-1164.

Abstract: The triglyceride cholesterol ester and phospholipid composition
of the lipids in fatty tissue, liver, heart, and brain of 31 healthy humans
(aged 20-80) was determined and discussed. All subjects consumed lard only
as the fat intake. The composition differed significantly in tissues and
organs in fatty acid content, but differed little in triglyceride and
phospholipid content. The age effect was only in the cholesterol content:
the aged subjects had generally higher cholesterol ester content except in
the brain. 12 references, including 5 Hungarian, 2 German, and 5 Western.

"The Potassium, Sodium, Calcium and Magnesium Content of Cardiac Muscle in Man."

Budapest, Orvosi Hetilap, Vol 108, No 11, 12 Mar 67, pages 493-495.

Abstract: [Authors' Hungarian summary] The amount of K, Na, Ca and Mg present in the muscles of the ventricle was studied in subjects who died suddenly from accidents, suicide or other causes. On the basis of the study, the K level of the heart of young males is higher than that of females of the same age group or of older males. The heart of young males contains less Ca than that of young females. The Ca content of the cardiac muscles of young males increases with advancing age but it will not exceed the values obtained in young females. The alkali and earth alkali metal composition of the female cardiac muscle varies with age. Cardiac damage (infarct, insufficiency) sustained by the advanced age group does not result in a change in the content of the metals studied in the total ventricular muscle tissue. 9 Hungarian, 10 Western references.

AUTHOR: Tarkhanov G.V.

TITLE: Statistical Processing of Data for Establishment of
Standard Specifications

PERIODICAL: Standartizatsiya, 1960, No. 12. pp. 7 - 10

TEXT: The author describes a method of interpreting statistical data on technical products for the purpose of establishing standard specifications. The manufacture of gear wheels is taken as an example and the demand for gear wheels with various numbers of teeth is shown in a diagram and in cumulative curves. The ends of the curves usually plotted have a slight slope to the ordinate, which fact affects the accuracy of the determination. Therefore a special cross-section paper is recommended for plotting diagrams on which the normal distribution of the demand is expressed as a straight line. The values of normal distribution over the range -3.5 to +3.5 are indicated on the ordinate, the values of the probability integral on a parallel scale, and the examined value x on the abscissa; this value can

Card 1/3

Statistical Processing of Data for
Establishment of Standard Specifications

S/028/60/000/012/002/007
B027/B076

change from x_1 to x_n . The whole range for the respective value is divided into sections and the demand corresponding to each section is indicated as value N_i , representing e.g. the annual program in pieces or roubles etc., i standing for the respective value. For each sector the frequencies are calculated. To avoid extrapolation it is important to select the marginal sectors correctly so that the frequencies are not in excess of 0.05 - 0.1. The respective frequency figures are plotted on the sector ends and connected by a curve; thus the cumulative curve for the distribution of the value x is obtained. Cumulative curves also facilitate the work when the interdependence of two values is investigated, i.e. seat and outer diameters of the gear wheel. The two-value distribution can be represented by a surface $P(x,y)$ on which these values divided into sections are indicated. If a certain volume of the surface is cut off by another surface and the lines of intersection are plotted, so-called contour curves are obtained which show the two-value requirements. By means of cumulative curves contour curves are obtained without calculating the analytical probability values. For this purpose the range of the values x and y is divided into

Card 2/3

Statistical Processing of Data for
Establishment of Standard Specifications

S/028/60/000/012/002/007
B027/B076

sections and for each section x the frequency of a certain section y is established and vice versa. The range of application thus established for the pair of values is used for the selection of standardized gear wheel types. On the basis of this method the most customary application ranges of characteristic values can be established and standardized and a great economic advantage is thus achieved. There are 8 figures and 2 Soviet references.

AUTHOR: Tarkhanov, K.S.

TITLE: The Self-Braking Condition of the Mechanism of Ball- and Socket Joints

PERIODICAL: Tr. Tul'skogo mekhanich. in-ta, 1958, Nr 8, pp 161 - 169

ABSTRACT: In order to facilitate the selection of parameters of the mechanism a derivation of the self-braking condition (blocking) of the mechanism was given in the form of an analytical function between the critical value for the angle of axial intersection and the parameters of the mechanism in the case of effecting the transmission at the great angle α . First α_{kr} for the ideal mechanism of the universal joint is determined, when the angles between the axes of the cross connection and between the axes of the cross connections and axes of the corresponding shafts are equal to 90° . Then the effects of a deviation of these angles from 90° , separately for each kind of deviation, are determined. The coefficient of safety is derived (warranting the impossibility of self-braking) which requires a more precise definition by experiments for a calculation of the whole complex of factors affecting the operation

Card 1/2

The Self-Braking Condition of the Mechanism of Ball- and Socket Joints

of the mechanism (lubrication, assembly, accuracy of finishing etc.). For preliminary rough calculations an equation of the analytical function between α and the parameters of the mechanism for the most general condition is proposed, i.e. if a deviation from 90° exists simultaneously at the angles between the axes of the cross connections and between the axes of the cross connections and the axes of the corresponding shafts.

TITLE: Treatment for unsaturated polyesters. Class 39, No. 173933 15

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 81

TOPIC TAGS: polyester, fire resistant material

ABSTRACT: An Author Certificate has been issued for a treatment for unsaturated polyesters involving acetic anhydride. To produce nonburning¹⁵ and water-resistant¹⁵ unsaturated polyesters, a chloral-modified unsaturated polyester is used, and the treatment is carried out with excess acetic anhydride with heating at 60—70°C min in the presence of a tertiary amine, e.g., triethylamine.
